## **REMARKS**

The Blood Culture Identification 2 (BCID2) Panel is a multiplexed nucleic acid test for the simultaneous qualitative detection and identification of multiple bacterial and yeast nucleic acids and select genetic determinants associated with antimicrobial resistance. The BCID2 Panel test is performed directly on blood culture samples identified as positive by a continuous monitoring blood culture system. Results are intended to be interpreted in conjunction with Gram stain results.

## Note

- 1. Results of the Sepsis panel are intended to aid in the diagnosis of infections in blood and are meant to be used in conjunction with other tests and clinical findings.

1. This assay is not intended to monitor the efficacy of treatment, serotyping, genotyping and speciation oforganisms included in the panel.

## INTERPRETATION

DETECTED: Indicates organism detected and identified is likely causing symptoms of disease. Co-Infection by more than one organism is not uncommon. However it does not distinguish between a viable or replicating organism and the presence of a nonviable organism or nucleic acid, nor do they exclude the potential for co-infection by organisms not contained within the panel.

NOT DETECTED: Indicates organisms tested in the panel were not detected and the symptoms may be caused by a condition other than an infection or a pathogen that was not tested for. Also a negative result maybe in concentrations below the level of detection by this assay or organisms are not included in this panel.
